

Please add the following claims 19-27:

Sub 1 19. (New) A system for parallelizing a computer application program based on a script of a script-driven software tool, comprising means for automatically analyzing the script and means for producing a parallel computation specification based on such analysis, where such parallel computation specification provides functional equivalence to the script when executed by a parallel runtime system.

A3 20. (New) A system for parallelizing a computer application program based on a script of a script-driven software tool, comprising means for automatically analyzing the script and means for producing a parallel computation specification plus a script fragment set based on such analysis, where such parallel computation specification and script fragment set provides functional equivalence to the script when executed by a parallel runtime system.

21. (New) The system of claims 19 or 20, wherein the means for automatically analyzing the script includes means for:

- (a) parsing the script into statements;
- (b) constructing a serial dataflow graph from the parsed statements; and
- (c) constructing a parallel dataflow graph from the serial dataflow graph.

22. (New) The system of claim 21, wherein the means for constructing the serial dataflow graph includes means for:

- (a) constructing a serial dataset table of datasets used by the script;
- (b) constructing a serial processing step table of statements performed by the script; and
- (c) constructing a serial dataset access table indicating datasets in the dataset table used by statements in the processing step table.

23. (New) The system of claim 21, wherein the means for constructing the parallel dataflow graph includes means for:

- (a) constructing a parallel dataset table of datasets based on the serial dataset table;
- (b) constructing a parallel processing step table of statements based on the serial processing step table;
- (c) constructing a dataset access table based on the serial dataset access table; and
- (d) determining, for each processing step identified in the parallel processing step table, if a corresponding pre-defined parallelization rewrite rule exists for such processing step, and if so, then applying the corresponding pre-defined parallelization rewrite rule to redefine associated entries in the parallel dataset table, the parallel processing step table, and the dataset access table as parallel processing entries; and if not, then defining such associated entries as serial processing entries.

AB 24. (New) The system of claim 23, further including means for resolving any existing partitioning conflicts in the constructed parallel dataflow graph.

25. (New) The system of claim 23, wherein at least one pre-defined parallelization rewrite rule is an algorithm selected from the group comprising simple partitioning, key-based partitioning, local-global division, external parallelism algorithm, and statement decomposition.

26. (New) The system of claims 19 or 20, wherein the script-driven software tool is SAS®.

27. (New) The system of claims 19 or 20, wherein the means for producing the parallel computation specification includes means for applying at least one pre-defined parallelization rewrite algorithm selected from the group comprising simple partitioning, key-based partitioning, local-global division, external parallelism algorithm, and statement decomposition.
